

POWER QUERY – CLEANING AND TRANSFORMING RAW DATA

- Rename the table as Customer Data
- Remove the estimated salary column
- Renaming columns
- Changing Data types
- Categorising the Product column > Add column tab > Column From Examples > New column named Products > Removing the product column
- Categorising the Age column by using the Conditional Column tab and create Age categories so we can analyse this data around those categories
- Categorising the Credit Score column by using the conditional column tab and create Credit Score categories so we can analyse this data around those categories
- Categorising the Balance column by using the conditional column tab and create Balance categories so we can analyse this data around those categories
- Sorting (re-ordering) the Age Groups, credit scores and Account Balance columns so It will be useful when creating charts and graphs. In order to do so, I duplicate the main table Customer Data, rename the newly created table as Age Groups, remove all the columns other than age Groups, remove duplicates in the column Age Groups. Now I need to create a conditional column called Age Groups ID and sort ascending the different age groups. The same procedure for Credit Score column and Account Balance column.

Add Conditional Column

Add a conditional column that is computed from the other columns or values.

New column name
Age Groups ID

	Column Name	Operator	Value		Output
Else If	Age Groups	equals	21 - 30	Then	2
Else If	Age Groups	equals	31 - 40	Then	3
Else If	Age Groups	equals	41 - 50	Then	4
Else If	Age Groups	equals	51 - 60	Then	5
Else If	Age Groups	equals	61 - 70	Then	6
Else If	Age Groups	equals	> 71	Then	7

Add Clause

Else

OK Cancel

- 3 custom columns to calculate the Min Churn Rate, Max Churn Rate & Target Churn Rate

[illegible]
